Text Styles

Text that appears in this style is used for screen text that appears in the uniFLOW user interface and on user interface controls.

Text that appears in this style is used for User entries on screen, text that the user actually has to type in.

Text that appears in this style is used for hyperlinks to an external web page, or internal links to other pages of this manual.

Text that appears in this style is used for code examples: XML code, variables or regular expressions.

Pictograms

Important note: Information that is crucial for the correct functioning of the uniFLOW software.

External manual: Pointer to additional manuals for third party hardware or third party software.

Region Specific Feature: In case some features of uniFLOW are not universally available, this icon will indicate it.

Link to an external reference within the WWW.

Detailed explanation of configuration settings or operational procedures.

Screenshots, pictures and graphics

This manual contains screenshots of the software, graphics explaining relations and pictures of products. All visuals are up-to-date at the time of writing. However, please note, that these visuals are subject to change.

- 1.1.2 Entering new Logon Data via the Login Manager on the MFP5

1 uniFLOW & Therefore™

Integration of Therefore™ for Scanning

uniFLOW provides the possibility to create scan workflows. A user can use the MomClient MEAP Applet on an MFP to scan pages and process them with a certain workflow in uniFLOW. It is possible to archive these scans into a Therefore™ category by using the workflow elements *Select Therefore™ Category* and *Send to Therefore™*.

The Chapter [Scanning](http://www.nt-ware.com/mom/5.2/HTML/EN/index.htm#14786.htm) <http://www.nt-ware.com/mom/5.2/HTML/EN/index.htm#14786.htm> in the uniFLOW v5.2 User Manual explains how scanning in uniFLOW works and how this is set up.

There, you'll also find the sub-chapter [Scan to SharePoint](http://www.nt-ware.com/mom/5.2/HTML/EN/index.htm#14807.htm) <http://www.nt-ware.com/mom/5.2/HTML/EN/index.htm#14807.htm>, which is similar to a Scan to Therefore™ workflow. The only difference here is that you have to exchange the respective SharePoint workflow element with the *Select Therefore™ Category* and the *Send to Therefore™* workflow element.

Requirements

- Install the Therefore™ XML Web Service on the Therefore™ Server.
- Install the Therefore™ Client on the uniFLOW Server and connect the Therefore™ client to the Therefore™ Server, i.e. configure the DCOM and the XML Web Service.

uniFLOW Login Manager and Therefore™

uniFLOW and Therefore™ have developed the following features to provide joint optimum services for MFP users:

[Automatic Login to Therefore™ from uniFLOW](#) (on page 2)

The single sign on mechanism available with:

- Therefore™ V6.2 SP 3 and
- uniFLOW V5.0 or higher and also for RPS

provides the facility of automatic login to Therefore™ after the user has been authenticated via the uniFLOW Login Manager. Users do not need to authenticate themselves twice, as was the case before: with uniFLOW, using their access control card for example, and then with Therefore™, entering their Windows Active Directory credentials, user name and password. Now users only have to identify themselves within uniFLOW, which automatically forwards their credentials to Therefore™.

The functionality of entering new credentials via the uniFLOW Login Manager "on demand" and thus to teach uniFLOW's new users' credentials is the same as for the eCopy ID Services integration. For further information, please refer to [Entering new](#)

[Logon Data via the Login Manger on the MFP](#) (see "[Entering new Logon Data via the Login Manager on the MFP](#)" on page 5).

Access to the Therefore™ repository using the Therefore™ MFP Connector

The Therefore™ MFP Connector for uniFLOW V5.0 and Therefore™ V6.2 SP 3 allows users to access the Therefore™ repository. Users can browse through the Therefore™ repository at the MFP and from there, print or delete scans.

1.1 Automatic Login to Therefore™ from uniFLOW

1.1.1 Settings to be done in uniFLOW for Therefore™

Preparation

For the integration of uniFLOW with the Therefore™ MFP Connector you may have to manually register the file `<Program Files>Common Files\NT-ware Shared\RSAEncrypt.dll` depending on the installed Microsoft .NET Framework Version. To register this file, search for `regasm.exe` (for example: `C:\windows\Microsoft.NET\Framework\v2.0.50727\regasm.exe`).

Afterwards, open a command shell and register the RSAEncrypt.dll with the following command:

```
C:\Windows\Microsoft.NET\Framework\v2.0.50727\regasm.exe
"<Program Files>Common Files\NT-ware Shared\RSAEncrypt.dll"
```

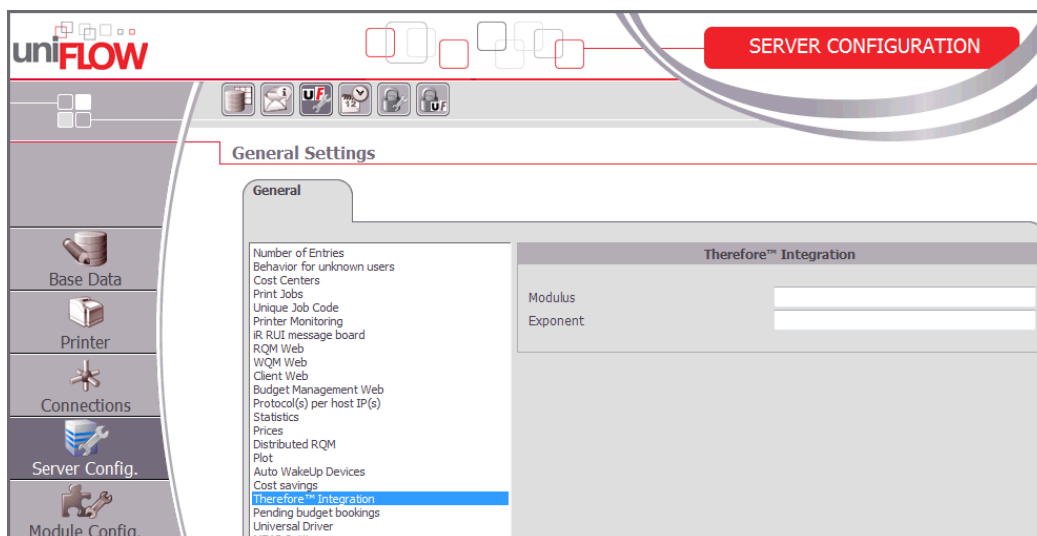

Printer Configuration

In uniFLOW a printer has to be configured for the relevant identification system that will be used (optionally microMIND or MIND plus uniFLOW Login Manager Identification). If you are unsure about the configuration, first use the respective wizard (for example *Secure Output Printer with uniFLOW Login Manager*) to create the printer and then edit it under Advanced printer configuration.

Password Encryption by RSA

After identification of the user at the device via the *uniFLOW Login Manager*, uniFLOW forwards the password to the Therefore™ device RSA encrypted.

Under *Server configuration/General Settings/General/Therefore™ Integration* the components of the Encryption Key need to be configured.

- **Modulus**
This RSA Public Key is stored centralized as ASCII hexadecimal representation. For further information on this public key, please refer to the Therefore™ manual "MFP Connector" which comes with Therefore™ V 6.2 SP 3.
- **Exponent**
This RSA Public Key is stored centralized as ASCII hexadecimal representation. For further information on this public key, please refer to the Therefore™ manual "MFP Connector" which comes with Therefore™ V 6.2 SP 3.

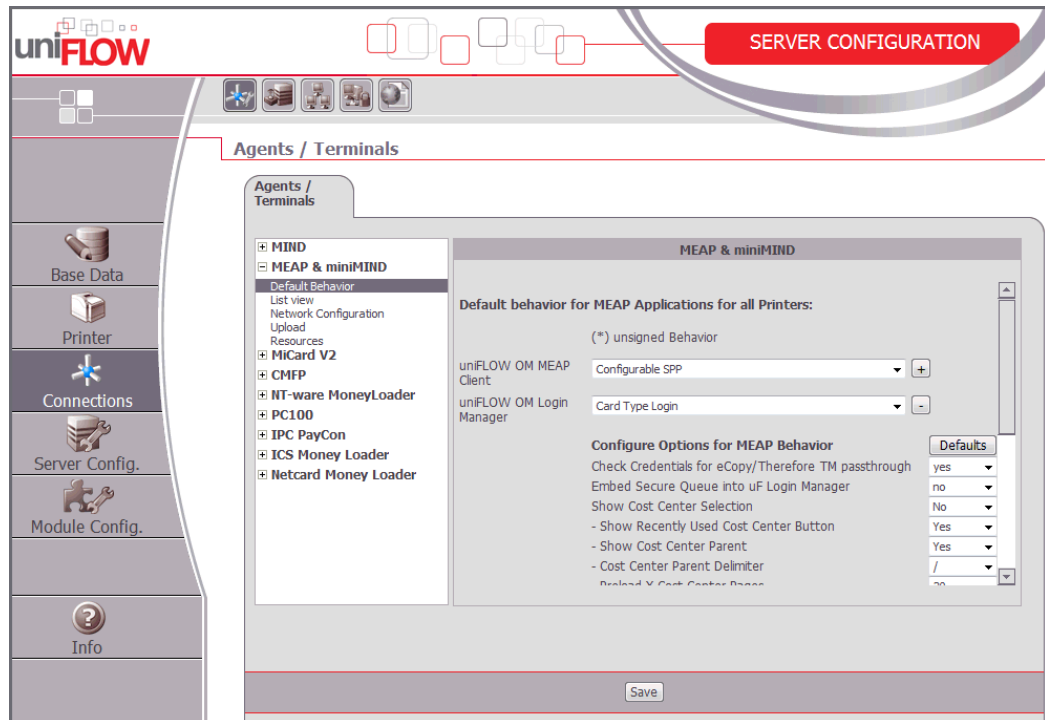

Configuration of the uniFLOW Login Manager

The uniFLOW Login Manager provides the following login types:

1. **Card Type Login**
2. **PIN-Code Type Login**
3. **Username/Password Type Login.**

All three login types offer the select box **Check Credentials for eCopy/Therefore™ passthrough**. If this has been selected, the user's credentials will be checked once the user tries to log on to the MFP, locked by the uniFLOW Login Manager. If the user's credentials have been successfully validated on the uniFLOW server, this information is passed through to eCopy/Therefore™. The user is then automatically logged on to eCopy/Therefore™.

The **Card Type Login** is shown below as an example.

For the rest of the configuration of the uniFLOW Login Manager and the used identification method please proceed as described in uniFLOW Login Manager.

User Configuration

Other than uniFLOW, Therefore™ needs a **Domain** name for the user logon. In order to enable a simultaneous login to both uniFLOW and Therefore™, the domain name has to be available in uniFLOW as well.

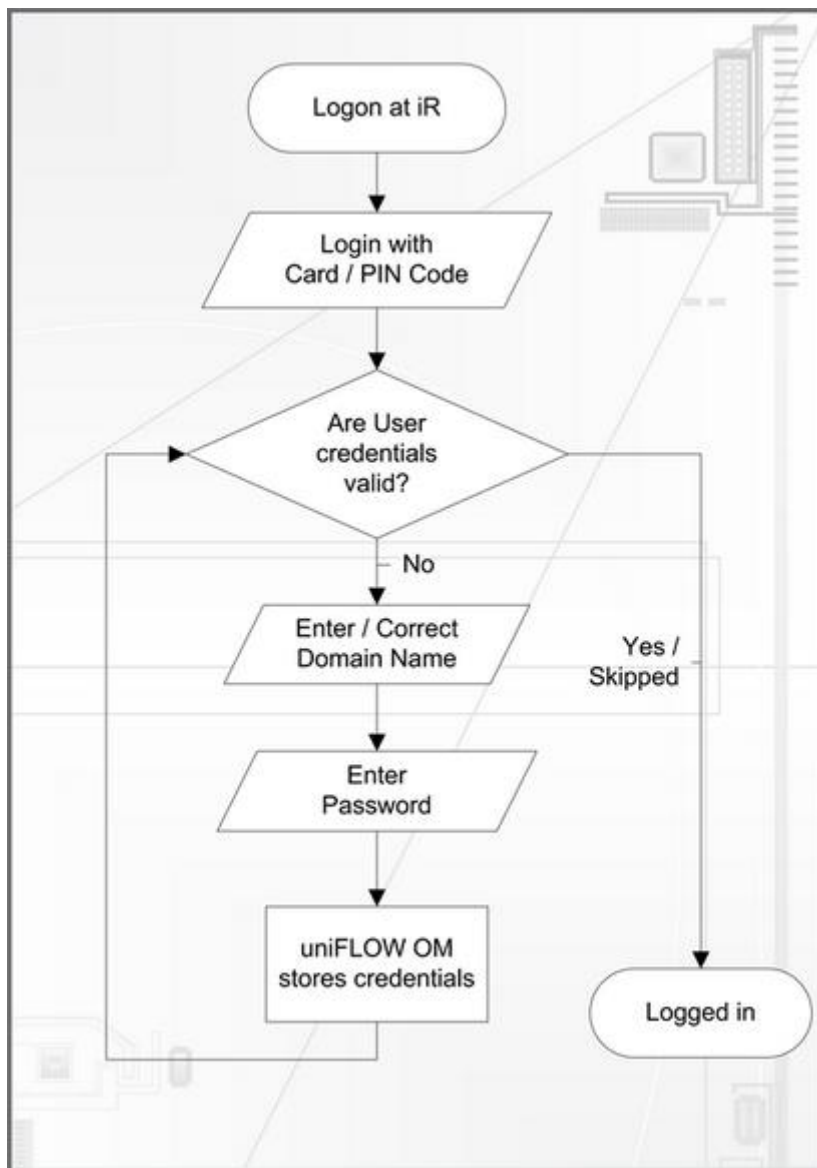

To achieve that, we have provided the **Set Password** window. For entering the domain name and password, please select the button **Set User Password** next to the Personal Folder entry field. Due to security reasons the password has to be entered by the users themselves. The domain name and the password entered in this pop-up window will be passed to Therefore™ after a successful logon. Thus, it is ensured, after a logon to uniFLOW, that all the necessary data for the logon are available on the Therefore™ device as well. Users are then authenticated within uniFLOW and Therefore™ at the same time. In case certain data is missing, e. g. the user password, the fields of the Therefore™ Login will, at the least, be pre-populated with the data which is already available.

In larger environments it would be quite time-consuming to enter the Domain name for every user separately.

Using Windows Active Directory the domain name of every user can be read out. For that reason we recommend having the users' domain names imported from the **Active Directory via LDAP**. For more information concerning LDAP, please see User Configuration Possibilities in uniFLOW .

1.1.2 Entering new Logon Data via the Login Manager on the MFP

If there are many users it is quite laborious for every user to walk up to the Administrator and enter the *Domain* name and/or the *Password*. To simplify the entering of new Login data, we have provided the possibility of entering the Login data via the uniFLOW Login Manager V2.0 or higher on the MFP as well. The advantage is obvious. No intervention of an administrator is necessary, users can enter their passwords "on demand".

1. Having logged on with card or PIN number it is checked whether the user has valid credentials (passwords) in uniFLOW in order to allow a Domain Logon.
2. Thereafter a screen for entering the logon details is displayed, where the user can enter data. If the domain name has been imported via LDAP the domain name will be pre-populated and only the password has to be entered. For security reasons it needs to be entered twice (*Retype Password*).

3. The entered data is checked. This may take a while. If the credentials are correct the logon process is completed and the user is logged on to the Therefore™ device.
4. If the credentials are not correct, the password entry form is redisplayed in which the logon data can be entered once again.

The users have to enter the logon data only once. The next time they identify themselves they will be logged on to the domain automatically.

This login is not mandatory. It can also be skipped by pressing *Skip*, for example if a user only wants to copy.

When the uniFLOW Login Manager V2.0 or higher is configured to check for Therefore™ user credentials on demand, the uniFLOW Server processes the following steps to check if the credentials are valid:

1. If the computer, where the uniFLOW Server is installed on, is a member of the same domain as the user to check the credentials for, uniFLOW tries to temporarily logon the user to the local system.
2. If this fails or the uniFLOW Server is not a member of the domain, uniFLOW tries to discover the Domain Controller by the NetBIOS domain name given by the uniFLOW Login Manager V2.0 front-end. If a Domain Controller is found, uniFLOW tries to authenticate the user against this Domain Controller.
3. If this also fails, uniFLOW tries to authenticate the user against each LDAP connector configured in uniFLOW for user import.
4. If none of the above has worked, the user's credentials are expected to be invalid.
